Bureau of Vital Statistics

SUMMARY FOR CALENDAR YEAR 1956

Introduction:

¹The 1956 vital statistics report appears as Part I of a two-part report entitled Public Health Statistics. Part II primarily contains morbidity data. The report has been divided in order to make easier distribution to groups interested primarily in one phase of statistics and yet keep the entire report intact for historical and research purposes.

Each year the Bureau of Vital Statistics has attempted to portray a different aspect of the field of vital statistics in the introduction to its annual report. This year the report will feature the historical background of vital statistics and the part it has played in the field of public health.

Historical Background:

The state of Missouri began the registration of births and deaths in the year 1910. However, the history of registration in the United States had its beginning in the early colonies. Christenings, marriages, and burial registration were not new to the settlers of the early English colonies. The registration of these vital events took place in England as early as 1538. That year the clergy in all of the parishes were required to keep a weekly record of such events.

In the New World, in 1632, a law requiring a minister or warden from each parish to appear annually in court and present a register of christenings, marriages, and burials for the year was passed in the Virginia Colony. These early records were used mainly as legal documents to protect the individual in the community.

As time passed, more emphasis was placed on complete registration. In 1644, the Massachusetts colony added a penalty clause for failure to record vital events, and in 1692, the town clerks of Massachusetts were empowered to be paid for each birth and death registered. While these laws were based on English precedent, they differed in two important respects; first, responsibility was placed on the government officers rather than the clergy, and the laws called for the recording of vital events; births, deaths, and marriages, rather than church related ceremonies. Many other colonies followed similar registration patterns. As time passed, machinery was set up to collect and preserve the records, not at first for statistical reasons but because authentic evidence was essential to the just administration of the law and the protection of an individual's rights.

¹The information contained in this introduction was abstracted from "Vital Statistics of the United States", Vol. I, 1950, United States Department of Health, Education, and Welfare, National Office of Vital Statistics. PP 2-19

The use of a recorded vital event as a basis of public health significance had its beginning in London as did the start of the registration program. An interest in public health statistics came about through the realization that death statistics could be used for the control of epidemics.

One of the earliest attempts to use vital events for the control of disease was by John Graunt, of London, England. In 1632, he published "Natural and Political Observations Mentioned in a Following Index, and Made Upon the Bills of Mortality." These bills of mortality were bills published during an epidemic of plague in the latter part of the 16th century. Graunt observed that vital events often follow regular patterns. The realization that vital events could tell the general truth about the population stimulated scientific interest in vital statistics.

As interest in vital statistics grew in England and Europe, the American colonists also seemed to gather an interest in their growing population. Death records of some sort were apparently kept by American settlers from the earliest date.

From the onset, disease ranked with starvation as a threat to the existence of many of the colonies. Malaria, Dysentery, and Typhoid Fever usually decimated settlers on new clearings. Smallpox, which was brought by the settlers themselves, and yellow fever, which came with the negro slaves, brought repeated devastation. Cotton Mather, a clergyman, and an early user of statistics in 1721, noted that during a very severe smallpox epidemic in Boston, more than one sixth of the natural cases died, but only one in sixty of the inoculated cases died.

During the 17th and 18th centuries, there was probably no permanent organization in English America to promote health. As the need arose, boards of health were formed. Baltimore in 1793 and Philadelphia in 1794, established a board of health in response to the yellow fever epidemic. Massachusetts enacted the first state law creating local boards of health in 1797. It appears certain that the early health officers began scanning burial returns or weekly lists of interment. These were roughly compiled into a statistical report. Baltimore has death records that date back to 1797. The general circumstances that led to action against disease led inevitably to revived interest in practicing vital registration and vital statistics.

As industrialism advanced around 1800, people began moving into the urban areas. As this move grew, the cities became aware of the problems relating to disease, the aging, and the charity needed to help the new inhabitants until they were established into a working force.

In England, Edwin Chadwick, secretary of the Poor-Law inquiry commission, became interested in vital statistics. He was aware of the differences in mortality by area or social group. These were the kind of vital statistics he needed for sanitary reform. Because of this interest, Chadwick strove to establish national registration of deaths.

Because of the devastating effects of cholera in 1831, Chadwick, in 1836, was instrumental in establishing a registration law which created a central registration office with the responsibility of the records and

statistics of births, marriages, and causes of death for all of England and Wales. Here was a historic turning point in the development of registration and public health.

Chadwick did much to inspire Lemial Shattuck, of Massachusetts. Shattuck in turn was instrumental in obtaining for Massachusetts, vital statistics legislation in 1844. This act required central state filing, provided for standard forms, fees, and penalties, specified types of information including causes of death, and the designation of registration officials.

In 1850, Shattuck presented to the legislature a report entitled, "Report of the Sanitary Commission of Massachusetts." He presented 50 specific recommendations including the creation of a state board of health. His program was based on complete registration of vital statistics. Shattuck anticipated almost all of the public health measures except those based on the still unborn science of bacteriology. Actually nearly 20 years were to elapse before Shattuck's detailed plans were to be adopted by the health department organic laws of Massachusetts.

As interest in vital statistics grew, the censuses of the United States started to include causes of death. The census of 1850 was the first to include causes of death and the number of births in the census enumeration schedule. This census and those that followed used this method but fell short by approximately 40 per cent in the reporting of deaths.

In 1880, an attempt was made to set up census registration areas. These areas contained those places that had satisfactory vital records in detail. In 1890, a recommendation was made that forms should be used to record a death. This was also the year that mechanical tabulators were used to tabulate the census.

In 1900, the census office further refined their methods through the use of death certificates. Twelve states adopted a death form in full, six states and the District of Columbia adopted it in part, and seventy one major cities in other states adopted the form in full or made revisions. The census of 1900 included figures obtained from well established registration areas which had adopted model laws and where it was believed that 90 per cent completeness of registration had been obtained. It was around the 1900 census that plans were under way to make the Census Bureau a permanent part of the government. Before this time, the census organization was disbanded between censuses.

In 1907, the American Public Health Association established a Vital Statistics section to develop closer working relationship among registration officials. During this time, many private and public agencies became concerned with the vital statistics program. These agencies worked hard to formulate a stronger and more efficient program. As the census bureau became a more permanent part of the government, it took a stronger stand relating to the registration of births and deaths. Among the more important steps initiated by the bureau was the formulation of principles and wording of a model law, drafting of standard forms and preparing the instructions for local registrars, physicians, and others. An increasing number of states were admitted to a death registration area in the 1910 census. Missouri was one of these states. The registration of births and deaths in Missouri was

started in 1910, with the registration of marriages and divorces following in 1948.

By the early 1930's, responsibility for vital records had been largely transferred from civil offices to health departments and more and more departments employed full-time health officers; therefore, they were able to make more intensive use of the records for statistical analysis.

In addition to using statistics to locate and deal with diseases, outbreaks, defective water, and sewage facilities, and related sanitation problems, many health departments used them as a basis for maternal, infant, and child care programs, immunization against childhood diseases and a variety of other personal health services.

The outbreak of World War II produced an additional shift in emphasis. Congress wrote into law provisions against the employment of aliens in certain defense projects, so that for the first time, the birth certificate was widely demanded as evidence of citizenship. It was estimated that nearly 55 million native persons who were living in 1940 had no birth record on file. When the United States entered the war, a conversion to all-out war production in the drive to employment in war plants started in earnest. In addition, separate legislation increased the need for certificates, for example, the emergency maternal and the infant care program for dependents of servicemen. Almost immediately, state registrar offices were swamped for the wholesale demand of birth certificates, often by persons born before the establishment of copy records.

With the start of the Korean War, a second wave of demand flooded the vital statistics program. As the use of vital records became a part of industry, the demands for these records increased. Today the records are used for insurance, employment, travel, inheritance, and many other problems relating to our daily lives. It is obvious that the use of vital records will become more and more important, and with this importance, new techniques must be devised for searching and maintaining the files. The records that were put on file in 1910 now show the ravages of age and constant use.

It will only be through careful planning that the records can be preserved for another twenty years. These records have played an important part in the history of public health. The future points to greater use of the records in health programs which rely more and more upon scientific evaluation.

	White	215	2.6	42	95	66	8	4				
	Non-White	34	2.8	5	18	8	3					
Other Diseases of Early Infancy (762-773)	Total	705	7.3	36	304	261	86	18				
	White	514	6.1	21	220	206	57	10				
	Non-White	191	15.8	15	84	55	29	8				
Premature Births (774-776)	Total	461	4.8	42	267	126	24	2				
	White	375	4.5	39	214	105	16	1				
	Non-White	86	7.1	3	53	21	8	1				
All Other Causes	Total	222	2.3	7	17	15	25	158				
	White	179	2.1	6	15	13	21	124				
	Non-White	43	3.6	1	2	2	4	34				

Numbers following Causes of Death are codes of the
International List, 1948 Revision.
Rates are per 1,000 Live Births.

TABLE I

RESIDENT MATERNAL DEATHS BY CAUSE AND COLOR WITH RATES.
MISSOURI: 1956

CAUSE OF DEATH	NUMBER			RATES		
	Total	White	Non-White	Total	White	Non-White
All Puerperal Causes (640-689)	53	32	21	5.5	3.8	17.3
Abortion with Infection (651)	2	1	1	.2	.1	.8
Abortion without mention of Infection (650-652)	2		2	.2		1.7
Puerperal Hemorrhage (643, 648, 670, 671, 672, 687)	15	10	5	1.6	1.2	4.1
Puerperal Infection (640, 641, 645, 1,680, 681)	-	-	-	-	-	-
Toxemias of Pregnancy (642, 685, 686)	13	7	6	1.4	.8	5.0
Other Accidents of Childbirth (673-678)	9	7	2	.9	.8	1.7
Other Puerperal Causes	12	7	5	1.2	.8	4.1

Rates are per 10,000 Live Births.

Numbers in parentheses refer to code numbers in 6th Revision of
International Statistical Classification of Causes of Death, 1948.

TABLE J

TEN LEADING CAUSES OF DEATH WITH RATES, MISSOURI: 1956
RESIDENT

CAUSE OF DEATH	White	Non-White	Total	Rates
1. Heart Disease (410-443)	16,131	1,326	17,457	419.3
2. Malignant Neoplasms (140-205)	6,279	612	6,891	165.5
3. Vascular Lesions (330-334)	5,134	515	5,649	135.7
4. Accidents (800-965)	2,380	292	2,672	64.2
5. Malformations and Diseases of Early Infancy (750-776)	1,553	360	1,913	46.0
6. Diseases of Digestive System (530-587)	1,490	172	1,662	39.9
7. Pneumonia (490-493)	912	204	1,116	26.8
8. Arteriosclerosis (450)	806	63	869	20.9
9. Diabetes Mellitus (260)	641	66	707	17.0
10. Nephritis and Nephrosis (590-594)	462	74	536	12.9
Totals	35,788	3,684	39,472	

Total Resident Deaths - 44,458

Estimated Population - 4,163,000

Rates are per 100,000 population.

Numbers in parentheses refer to code numbers in 6th Revision of
International Statistical Classification of Causes of Death, 1948.

Chronic rheumatic heart disease (410-416)	9	
Arteriosclerotic and degenerative heart disease (420-422)	259	11
Other diseases of heart (430-434)	4	1
Hypertension with heart disease (440-443)	33	8
Hypertension w/o mention of heart (444-447)	5	3
Other diseases of circulatory system (450-468)	21	2
Influenza (480-483)	1	
Lobar pneumonia 4 weeks (490)	5	3
Bronchopneumonia 4 weeks (491)	14	2
Pneumonia, other forms 4 weeks (492-493)	10	1
Bronchitis (500-502)		
Gastro Enteritis and colitis, 4 weeks - 2 years (571.0)	1	1
Gastro Enteritis and colitis, 2 years (571.1)		
Cirrhosis of liver (581)	10	
Other diseases of digestive system (530-587 excl. above)	20	1
Nephritis and nephrosis (590-594)	5	1
Complications of pregnancy and puerperium (640-652; 670-689)	2	
Congenital malformations (750-759)	11	2
Birth injuries, asphxia, (under 4 weeks.) (760-762)	18	5
Pneumonia of newborn (under 4 weeks) (763)	3	1
Diarrhea of newborn (under 4 weeks) (764)		
Other infections of newborn (under 4 weeks) (765-769)		
Other diseases of early infancy (under 4 weeks) (770-776)	18	4
Senility, ill defined and unknown causes (780-795)	30	6
All other diseases (residual)	22	7
Motor vehicle accidents (810-835)	17	3
All other accidents (800-802; 840-965)	17	3
Suicide and self-inflicted injury (970-979)	9	
Homicide (980-985)	1	2

* The Bureau of Vital Statistics does not designate the following cities by population size.

CITIES 2,500 - 10,000

Berkley City
Breckenridge Hills
Brentwood
Florissant City
Glendale City
Hillsdale Village
Kinloch City
Ladue City
Normandy
Pagedale City
Pinelawn City
Rock Hill City
St. Ann City
St. John's City
Shrewsbury City
Valley Park City
Wellston City

These cities are not included in the State Total figures which have been grouped by population size on the preceding pages.
